

Kelvin & Lumen

COME LEGGERE KELVIN E LUMEN:

Quando si sceglie una lampada, due valori aiutano a capire subito che tipo di luce offrirà: Kelvin (K) e Lumen (lm).

I Kelvin indicano il colore della luce, più calda o più fredda, mentre i Lumen misurano quanta luce viene emessa.

Conoscere questi due parametri permette di scegliere la lampada più adatta all'ambiente e all'atmosfera desiderata, evitando dubbi e confronti complicati.

La tabella qui sotto offre una guida semplice e immediata per interpretare correttamente entrambi i valori.

HOW TO READ KELVIN AND LUMEN

When choosing a lamp, two key values help you understand what kind of light it will provide: Kelvin (K) and Lumen (lm).

Kelvin indicates the color temperature of the light, whether it's warm or cool, while Lumen measures how much light is emitted.

Understanding these two parameters makes it easier to select the right lamp for your space and desired atmosphere, avoiding confusion and unnecessary comparisons.

The table below offers a simple and immediate guide to help you interpret both values correctly.

Parametro Parameter	Cosa indica What it indicates	Come si interpreta How to interpret it	Esempi utili Useful examples
Kelvin	Temperatura colore Color temperature	Luce calda / neutra / fredda Warm / neutral / cool light	2700K caldo - warm 4000K luce solare - daylight 6000K freddo - cool
Lumen	Quantità di luce Light output	Più lumen = più luminosità More lumens = brighter light	300 lm soffusa - soft 800 lm standard 1500+ lm forte - strong

Il catalogo **GES International** propone lampade con più pulsanti, offrendo diverse modalità luminose per adattarsi a ogni ambiente.

The **GES International** catalog offers lamps with multiple buttons, providing various lighting modes to suit any environment.
